3. Output Characteristic $I_c = F(V_{ce})$ at Constant I_B

- Set up the circuit in the following figure:

- Set the current to 200 µA
- Vary E_2 and fill in the following table:

V_{CE} (V)	0	0.1	0.2	0.3	0.4	0.5	0.6	1	1.5	2	2.5	3
I_c (mA)												

V. Using the measurements taken.

1) Plot the $I_c = F(V_{BE})$ characteristic on graph paper

➤ Deduce from this characteristic:
- The threshold voltage
- To which electronic component can the base-emitter junction of the transistor be compared? Justify your answer.

2) Plot the $I_c = F(I_B)$ characteristic on graph paper at constant VCE

Deduce from this characteristic:

The β - gain I_c/I_B. Compare this gain with that given by the constrictor: $200 < \beta < 450$
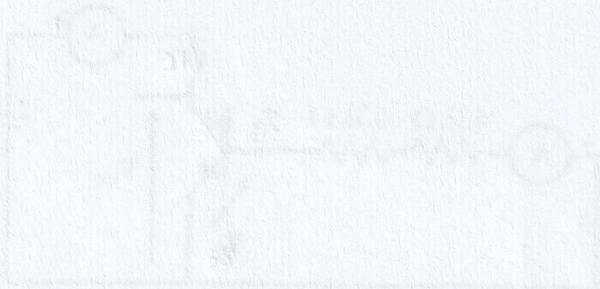

3) Plot the $I_c = F(V_{ce})$ characteristic at constant voltage on graph paper.

➤ Deduce from this characteristic:
- The two operating regions of the transistor.

VI.   Conclusion
   Draw a suitable conclusion regarding this lab

1/

? *Traceability of characteristics:* $I_B = f(V_{BE})$
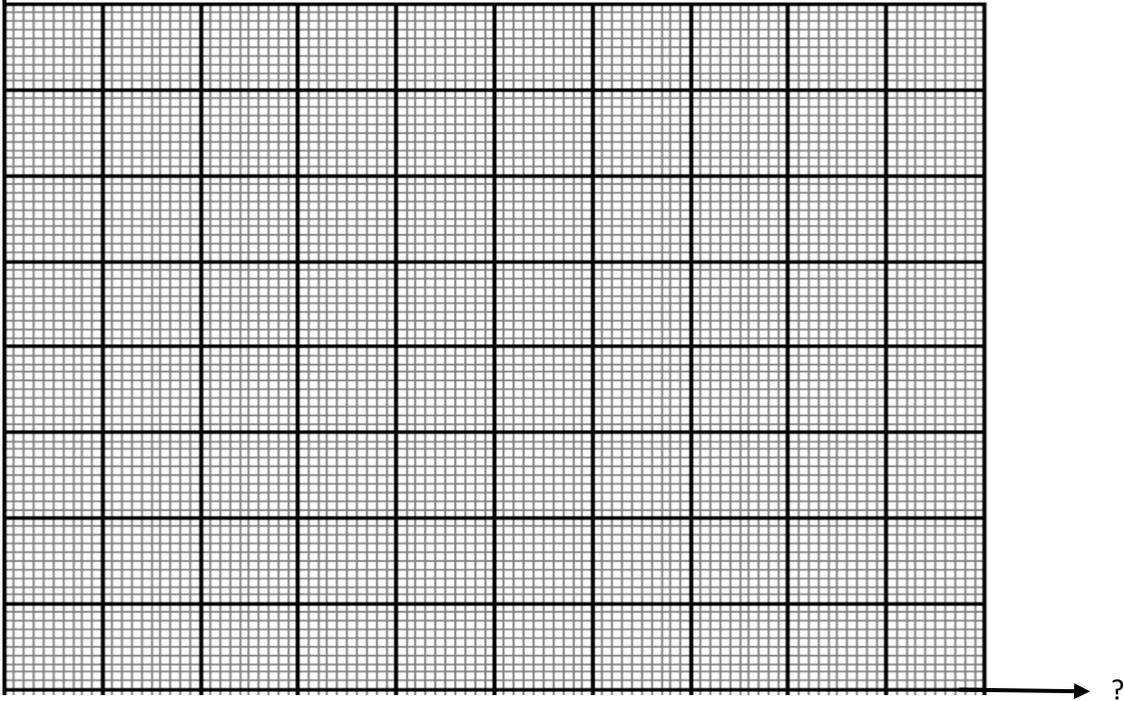

?

2/

?

Plotting the characteristic: Ic= f (IB)

?

3/

?

Traceability of the characteristic: $I_C = f(V_{CE})$

?

VII) Conclusion: draw an appropriate conclusion about this practical assignment.
