
LAB ASSIGNMENT 07

(Context Menu and SQLite in Android)

In this Android application, the **First Page** contains a text element located in the center of the screen displaying "**App Dataset**". A context menu must be associated with this text, which appears when the user performs a long press on it and provides two actions: *edit* and *delete*.

You must also integrate a **SQLite database** to manage this text. The Edit option should allow updating the stored value in the database, while the Delete option should remove the corresponding record.

The aim of this task is to combine the use of context menus with local data management using SQLite.
